# INTRODUCTION

Welcome to the Emotion Detector!

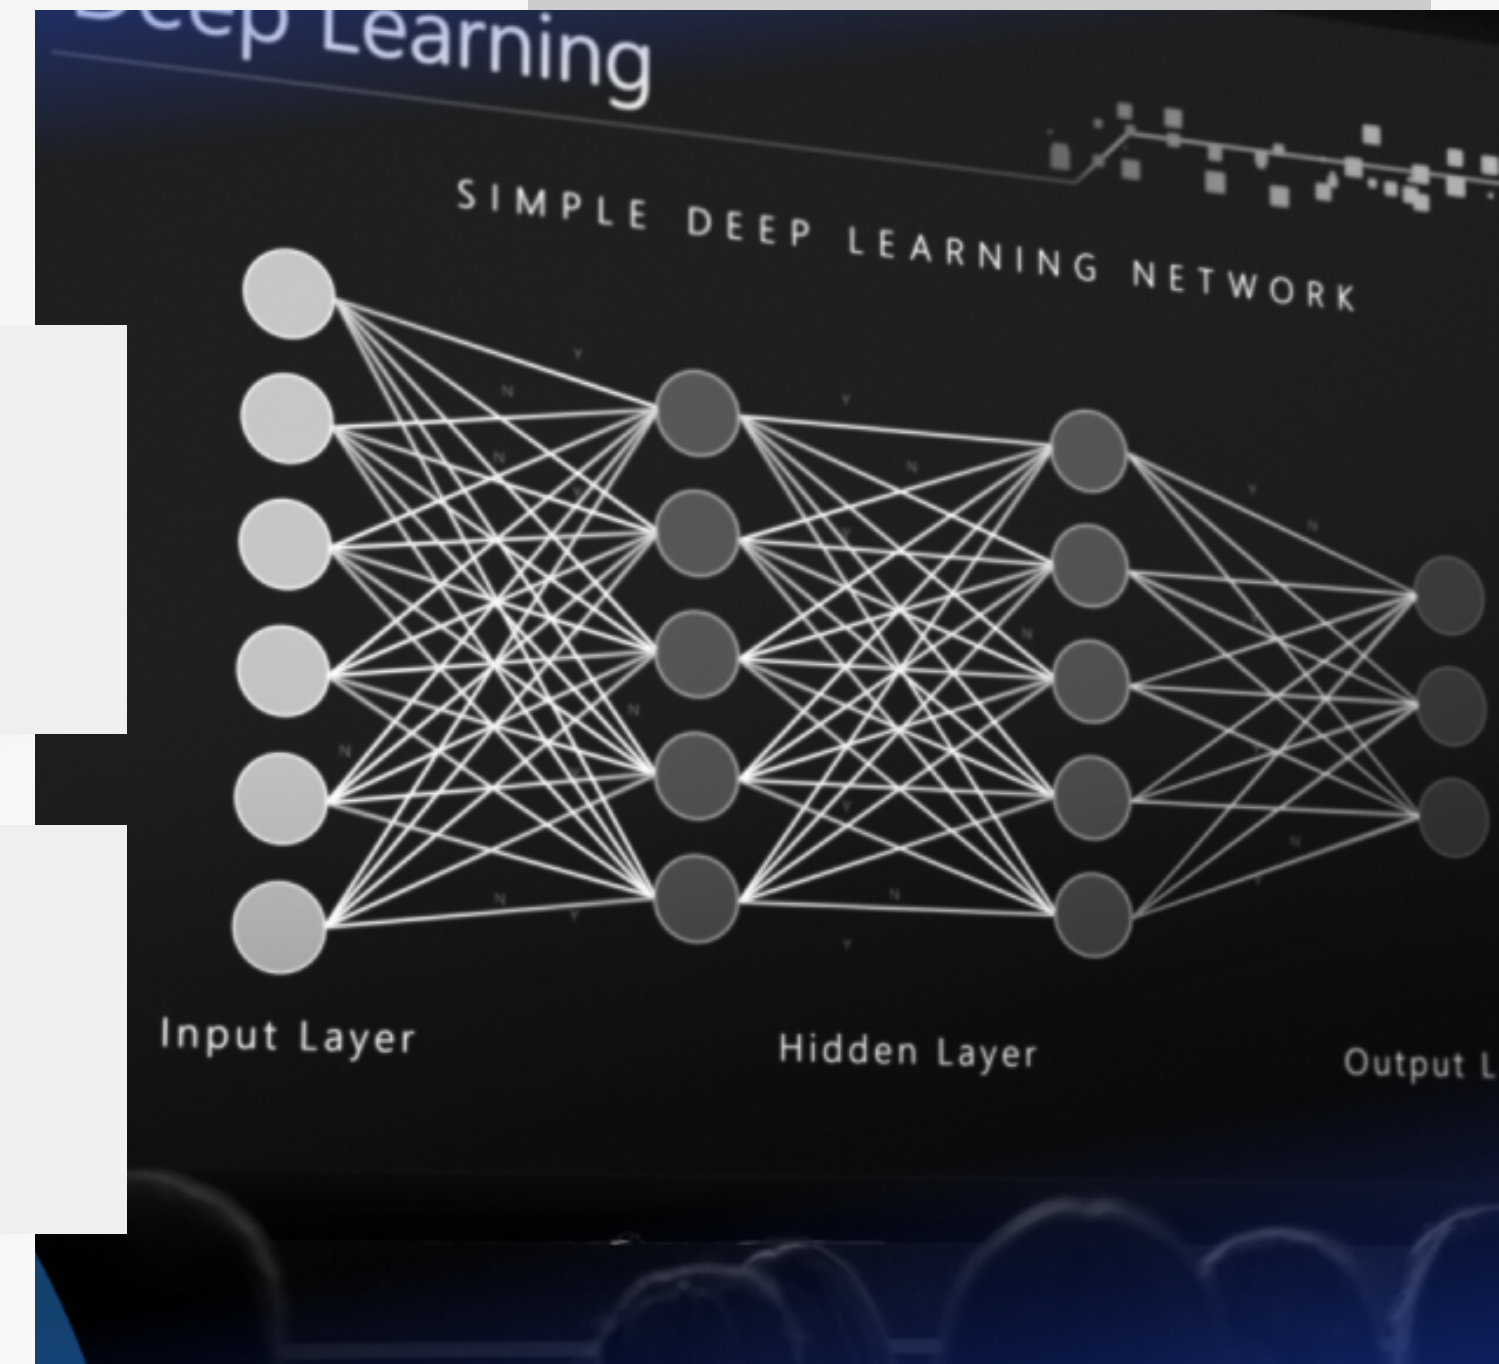

# WHAT IS IT?

This project is a web application that uses computer vision and deep learning to detect facial emotions in real-time.

Users can interact with the application by turning on their webcam, taking a snapshot of their face and the application will detect their emotions in real-time.

# TECH STACK

Exploring the tools used in building the project

# TECH STACK

- HTML
- CSS
- JavaScript
- Bootstrap
- ScrollReveal.js

**FRONTEND**

- Flask
- OpenCV (cv2)
- NumPy
- Tensorflow
- PIL
- Base64

**BACKEND**

- Git
- GitHub

**VCS**

# HOW IT WORKS

Diving into the intricacies of each component's  
functionality

01

## SNAPSHOT

Users can interact with the application by turning on their webcam and taking a snapshot of their face.

02

## GRAYSCALE

The captured image is processed using OpenCV and converted to grayscale for face detection.

03

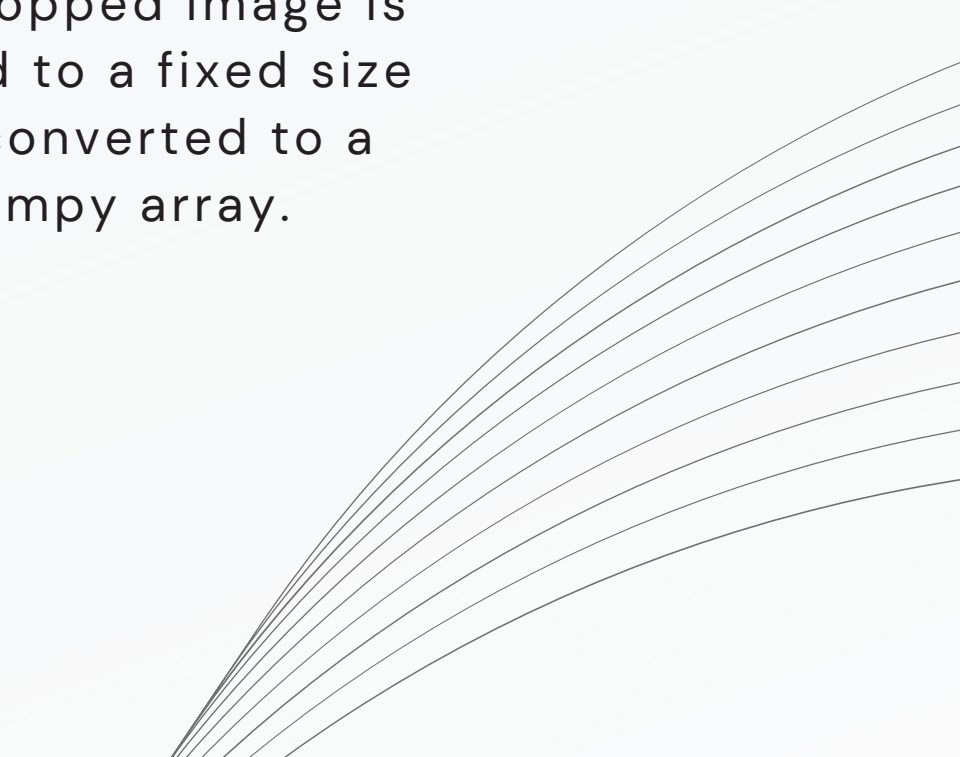

## HAAR CASCADE

The Haar cascade classifier is used to detect faces in the grayscale image. If a face is detected, the application draws a rectangle around the face and crops the image to focus on the detected face.

04

## RESIZE

The cropped image is resized to a fixed size and converted to a numpy array.

05

**PREDICTION**

The model predicts the emotion label for the processed image from a set of predefined classes such as Anger, Disgust, Fear, Happy, Neutral, Sadness, and Surprise.

06

**LABEL OVERLAY**

The predicted emotion label is overlaid on the original image, and the resulting image is encoded as a JPEG string.

07

**RESPONSE**

The web application sends the predicted emotion label and the encoded image back to the user interface for display.

08

**RESULT**

The user can see the original snapshot and the predicted emotion alongside it.

# DEMONSTRATION

Let's view the website live in action!

# *Emotion Detector*

Slide here for some fun

Detect your  
*emotions* :)

**Hardvan/EmotionDetector**

Contribute to Hardvan/EmotionDetector development by creating an account on GitHub.

# WEBSITE LINK

# RESOURCES

For more information about the project

# RESOURCES

## *JupyterNotebook*

Contains information about the data preprocessing, model architecture & training. Results visualization & model accuracy calculations are also displayed.

Contains the source code for the "Emotion Detector" Project. Feel free to explore & contribute to the project if you wish to!

## *GitHub Repository*

**THANK YOU**
